Europe reclaims tap-to-pay

The Problem

Tap-to-pay in Europe lives with Google and Apple

200–250M

Europeans use Apple Pay or Google Wallet for in-store purchases[1]

€500B+

in mobile wallet payments at European point-of-sale terminals (2024)[2]

<0.4% combined market share for everyone else.[3] No legitimate tap-to-pay alternative exists for either iPhone or Android.

Apple Pay

- Charges European banks ~0.05% per transaction [4]
- Extracts €300–500M from European transactions [5]

Google Wallet

- Harvests every transaction for ad profiles and selling to 3rd parties [6]
- Estimated €1B+ annually in ad value from European payment data [7] [8]

The only alternative is to go back to physical cards or cash. For Europeans who care about privacy, there is no tap-to-pay option at all.
